Summary

I'm a C++ developer with some experience of Python and a big passion for functional programming/Haskell. My favorite topics include distributed systems (with specialized education) and compilers (as an amateur).

Education

Higher School of Economics — 2018–2025

B.S in Applied Mathematics and Informatics

Specialization: Distributed systems

Experience

Yandex — July 2019–September 2019

C++ intern

- Maintained existing code
- Created async C++ client for an internal service
- Created a Markdown plugin for internal documentation builds
- C++ • Python • Backend • Distributed systems • Build systems

Kaspersky — November 2020–April 2022

Haskell/research intern

- Implemented compilers for simple languages described in research
- Haskell • Compilers

Yandex — August 2022–April 2023

Junior C++ developer

- Sped up a particular stage of satellite image processing by several orders of magnitude (over a day → minutes)
- Integrated said algorithm to run regularly within the pipeline
- Maintained existing code, including refactoring a significant portion of it into more modern C++ and adding new library features
- C++20 • Backend • Distributed systems • Geo

Skoltech — December 2025–present

C++ developer

- Worked on compiling, integrating and testing existing 5G station software
- Set up CI/CD pipelines to automate aforementioned processes
- Helped researchers modify 5G Massive MIMO algorithms and improve signal quality at low SNR
- C/C++ • Linux • Gitlab CI/CD • 5G/6G

Skills

Programming Languages	Experienced: C/C++ | Haskell Familiar: Javascript | Python | Bash
Software Development	OOP | FP | GIT | CLI | Linux Distributed systems
Frameworks & Libraries	STL | Boost | GDAL | NumPy

Extra

- I also love algebra, and have quite a bit of experience there. Here's my algebra project written in Haskell for my coursework. It's actually quite impressive — performance outclasses similar C++ projects, and EDSL it provides is nice (for my taste).
